Dengue virus type 4 (DEN-4)

Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

Viruses; Dengue virus group.

1 (Dases 1 to 2552)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   replicon
                                                                                                                                   PCR primers which may be used to detect Dengue virus in a sample. Dengue virus is a member of the flavivirus family and causes diseases including dengue fever (DF) and dengue haemorrhagic fever. The invention also comprises a method for detecting and quantitating dengue virus. The dengue virus-specific primers of the invention are useful in reverse transcriptase-polymerase chain reaction assays, particularly for detecting or quantitating dengue virus specific RT-PCR primer used in the method of the invention
                                                                                                                                This invention relates to novel Dengue virus reverse transcriptase (RT)
                                                                                                                                                                                                                                                                                                                                                        Gaps
                                         New dengue virus-specific primers, useful for reverse transcriptase-
polymerase chain reaction assays, particularly for detecting or
quantitating dengue virus in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Virus-like particle vaccines containing dengue virus recombinant re
as core for carrier, applicable in preventives or/and remedies for
like cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                        ö

of the front 20 amino acids in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NSI protein signal; ocding regions of all non-structural proteins. The obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (PRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to a Dengue virus DNA sequence used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a pharmaceutical composition capable of inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       an immune response in a mammalian subject, comprising an immunogenic amount of a eukaryotic plasmid expression vector in pharmaceutical form, which includes the envelope and membrane (PreM) genes of a dengue type 12, 3, or 4 virus. Dengue virus (Den) belongs to the flavivirus genus of the family Flaviviridae and is a positive strand RNA virus encoding ten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New pharmaceutical compositions containing dengue nucleic acids, useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pharmaceutical; ds, immune response; immunogenic; envelope; membrane; PreW; dengue virus; Den; serotype; flavivirus; Flaviviridae; antigen; mosquito; Aedes aegyptii; acute undifferentiated fever; dengue abock syndrome; DSS; immune enhancement phenomenon; DNA vaccine; gene therapy; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa

                                                                                                                                                                                                                                                                           ö
           host and viral proteinases. The virus envelope protein is a major antigen which can be targeted by neutralising antibodies. The membrane protein also appears on the virion surface and is required for proper processing of the envelope protein. Dengue viruses are transmitted primarily by the mosquito, Aedes aegyptii, and can lead to human illnesses ranging from acute undifferentiated fever to dengue haemorrhasic fever (DHF) and dengue shock syndrome (DSS). Secondary, with a different serotype, may lead to an immune enhancement phenomenon. The compositions of the invention are DNA vaccines which are injected into the animal as a technique of gene therapy. The composition is useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection. The sequence presented is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel immunogenic composition being tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is
 proteins. These genes are translated as a polyprotein which is cleaved by

useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in subject to be vaccinated since each component of the vaccine possesses the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-structural proteins present in each dengue virus serotype. The present sequence is that of the DENI MB chimeric region DNA which is related to

This cDNA sequence encodes the capsid, prW, envelope (E) and NSI proteins (see AAY05522) of serotype 2 dengue virus DEN-2 strain PR159/S1. This strain served as the source for DEN-2 genes used in the invention. A vaccine for protecting against flavivirus infection comprises a dimeric 80% E protein that has been secreted as a recombinant protein from a eukaryotic cell. 80% E indicates a C-terminally truncated flavivirus E. The dimeric truncated E is formed: (1) by directly linking 2 tandem copies of 80% E via a flexible tether; (2) via the formation of a leucine zipper domain through the homodimeric association of 2 leucine zipper helices each fused to the C-terminus of an 80% E molecule; or (3) via the
                                                                                    A cDNA sequence of dengue virus serotype 2 (DEN-2) mutant strain PR159/S1 shows 4 differences from the wild-type DEN-2 PR159. This results in a conservative mutation in domain B of S1 that may be involved in the attenuation of this small-plaque, temp.-sensitive variant. The cDNA encodes the capsid, pre-membrane, envelope and NS1 proteins (AAW09409) of the virus. The clone can be used to express recombinant secreted polypeptides, comprising portions of the envelope protein (esp. domain B, G1y266-G1y385), in eukaryotic hosts, e.g. yeast (see also AAT47667 and AAT47703-04) and Drosophila, for use in subunit vaccines against viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant dimeric flaviviral envelope vaccine - comprising a dimeric 80% protein, useful for protecting against flavivirus, especially dengue virus infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a vaccine for protection against Flavivirus infection comprising a dimeric 80% envelope (E), which has been secreted as a recombinantly produced protein from Drosophila Schneider cells and
formation of a non-covalently associated four-helix bundle domain formed upon association of two helix-turn-helix moleties attached to the Creminus of an 804 B molecule. Dimeric truncated DEN-2 B proteins are efficiently secreted by recombinant calls, are easier to purify than intracellular proteins, and generate a high titer neutralising antibody response. The method is generally applicable to flaviviruses, in particular dengue viruses such as DEN-2, where 804 E comprises amino acids 1-395 of DEN-2 B. The products can also be used for diagnosis of infection. (Updated on 17-OCT-2003 to standardise OS field)

       Flavivirus, an immunogenic polypeptide comprising a dimeric 80% B, an immunogenic composition for protection against Flavivirus an immunogenic polypeptide comprising a dimeric 80% B, an comprising the immunogenic polypeptide and a carrier, an immunodiagnostic for detecting Flavivirus comprising the immunogenic polypeptide and a carrier, an immunodiagnostic for detecting Flavivirus comprising the immunodiagnostic kief recombinant DNA expression system, a DNA sequence encoding the immunogenic polypeptide and an immunodiagnostic kit for detecting Flavivirus in a test subject. The dimeric 80% E products are envelope Flavivirus is a dengue virus. The 80% E protein is produced as a dimer by incorporating a helix-turn-helix peptide, to encourage dimerisation. The vaccine is useful for protection against dengue virus infection (e.g. bengue haemorrhagic fever, DHF, and Dengue shock syndrome, DSS). The present sequence is the partial genomic sequence of the DBN-2 strain
                                                                                                                                                                                                                                                                   ö
which represents the N-terminal 80% portion of the protein from residue 1
                                                                                                                                                                                           PR159/S1 virus, encoding the capsid, membrane, envelope and NS1 proteins.

cc neutralising antibody response to a Flavivirus in a murine host. The vaccine comprises a therapeutic amount of a dimeric 80%E, the dimeric 80%E thating been secreted as a recombinantly produced protein from Drosophila Schneider cells, and where 80%E represents the N-terminal 80% cortion of the protein from residues 1-195. Also described are: an immunogenic polypeptide comprising the dimeric 80%E cited above; an immunogenic composition that generates a protective, neutralising the above immunogenic polypeptide and a physiclogical carrier; a multivalent immunogenic for the detection of Flavivirus, comprising the above immunogenic polypeptides of at least 2 flavivirus at least 2 of the above immunogenic or immunogenic composition of Flavivirus and a test control of the above immunogenic or multivalent immunodiagnostic composition is useful for the detection of Flavivirus in a test collabeled antibodies immunocactive to antibodies from the test subject. The composition is useful for preventing or diagnosing infections caused by dengue virus. This sequence encodes Dengue virus gene viral capsid, prw, E and NSI genes for the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as backbone into which the structural genes of the virus are used as backbone into which the accompanying clinical symptoms of viral disease. Attenuated chimeric inviviruses are combined in a pharmaceutical composition to confer accompanying clinical symptoms of viral disease. Attenuated chimeric laviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses on a dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunoganic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-4 (DEN-4) 1036 virus protein used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) to DEN-4, are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, protein (E) encoding region, followed by the region encoding non-structural proteins (NSI-NSIA-NSIA-NSIA-NSIS) and finally a 3' enroccing region. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flavivirus; Dengue virus-4; DEN-4; vaccine; infection; virucidal; mutein; avirulent; immunogenic; viral disease; pharmaceutical; mutant; variant;
                                                                                                                                                                                                                                                                                                                                                                                               Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the atructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the cocompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pethogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-4 (DEN-4) PDK-48 virus protein variant used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (B) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (NSI-NSZA-NSZA-NSZA) and finally a 3' non-coding region. DEN-4 virus passaged in primary dog kidney (PDK) cells these is designated as DEN-4 PDK-48 virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kinney RM, Kinney CYH, Butrapet S, Gubler DL, Bhamarapravati N;

                                                                                                                                                                                                                                             ö
                                                                                                         The present invention relates to novel mutated flaviviruses comprising a putation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations of the invention and engue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain rDEN4 DNA
                                                    New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.

The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and youth characteristics of infection. The present sequence is Dengue virus type 4 strain 2A DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 10649 BP; 3302 A; 2212 C; 2800 G; 2335 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA cequence encodes dengue virus (DNN)-2/3-VPI fusion protein related to the invention. This fusion protein contains attenuated DEN-2 DNK-53V backbone comprising a valine at the non-structural protein (NS3)-2/5 on dut he premembrane/membrane protein (PMM) and an envelope protein (B) from wild-type DEN-3 16562 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                Butrapet S, Gubler DL, Bhamarapravati N;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The polyprotein comprises the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. A clone of this wildtype viral sequence, PDK 454, NS4B and NS5 proteins. A clone of this wildtype viral sequence, PDK provides immunity against all four scrotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four scrotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue hasmorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant protein products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus sercitypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/1-VP1 fusion protein confers invention. This fusion protein contains attenuated DEN-2 DEN-53V backbone comperising a valine at the non-structural protein (NS3)-250 and the premembrane/membrane protein (prM) and an envelope protein (E) from wild-type DEN-1 16007 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-

                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                               This sequence encodes the polyprotein from an attenuated derivative of Dengue 2 virus, strain 16681. The derivative is designated PDK-53. The polyprotein comprises the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. The PDK-53 viral sequence may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/3 virus, and of a chimeric DEN-2/3 virus, and chimeric DEN-2/3 virus, and chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever of fatal dengue hemocrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant products of the DNA constructs which are used in the vaccines.

comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of thee virus are used as a backbone into which the structural genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/4-VPI fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (NS3)-250 and the premembrane membrane protein (pM) and an envelope protein (B) from wild-type DEN-4 1036 virus. (Updated on 11-SEP-2003 to standardise OS field)

New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent; immunogenic; viral disease; pharmaceutical; chimeric; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                      The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavavirus. The diagnostic kit is useful in diagnosting flavivirus inflection caused by DENV, WNV, NV or S.EEV. This sequence correspondithe complete nucleotide sequence of the DENV isolate New Guinea.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 10724 BP; 3542 A; 2212 C; 2725 G; 2245 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 28; DB 12; Length 10724; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                           The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-2 (DEN-2) PDK-53 virus protein to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5, non-coding region, followed by a capaid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-coding region, followed by the region encoding non-coding region, surractural proteins (NSI-NS2A-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                      ઠે
                      The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses cuch as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4, Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/MN-PPI fusion protein related to the invention. This fusion protein contains DEN-2 16681 backbone and the premembrane/membrane protein (prM) and an envelope protein (B) from West of the NY99. (Updated on 06-AUG-2003 to correct OS field.) tetravalent and containing a common uncleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a vircide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccineted since each component of the vaccine possesses the same deltai0 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel immunogenic composition being tetravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunogenic composition; dengue type 1; dengue type 2; dengue type 3; dengue type 4; virucide; immunostimulant; vaccine; tetravalent vaccine; dengue virus; delta30; attenuating mutation; humoral response; cellular response; non-structural protein; structural protein; dengue virus serotype; gene; ds; plasmid P2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                          )structural proteins present in each dengue virus serotype. The prest sequence is that of the DEN2 cDNA plasmid P2 which is related to the

immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses the same deltain attenuating deletion mutation. The vaccine possesses to induce humoral and cellular responses against a lof the (non-structural proteins present in each dengue virus serotype. The present sequence is that of the DENI CME chimeric region DNA which is related to

DENI virus, strain S275/90 was isolated from the serum of a dengue haemorrhagic fever (DHF) patient. RNA was isolated from the virus and used to prepare CDNA encoding DENI polypepitdes. Dengue Virus fype i prods. can be used for detection, diagnosis, vaccines (inactivated form) or treatment of DENI infections. The sequences given in AAQ51477-86 are oligonucleotides used to prepare CDNA fragments corresp. to Dengue virus proteins, by PCR. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present CDNA sequence encodes dengue virus (DEN)-2/1-VP fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone composing rotain a valine at the non-structural protein (NS3)-250 and the protein (E) from wild-type DEN-1 16007 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simulateous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines concer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/1-VV fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (BIM) and an envelope protein (C), premembrane/membrane protein (BIM) and an envelope protein (C) from the vaccine strain of Dengue-1 (DEN-1) PDK-13 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plavivirus, Dengue virus-1, DEN-1, vaccine, infection, virucidal, mutein, avirulent, immunogenic, viral disease, pharmaceutical, mutant, variant,

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogene or multivalent vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-1 (DEN-1) PDK-13 virus protein variant used for constructing flavivirus chimeras Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding protein (E) encoding region, an envelope structural proteins (NS1-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric flaviviruses that are avirulent and immunogenic, useful for

                                                                                                                                                                                                                                                                                                                                   mutation
```

```
The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the accompanying clinical symptoms of viral disease. Attenuated chimeric laviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses clinavirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-1 (DEN-1) 16007 wirus protein cused for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) contains 5, non-coding region followed by a capsid protein (C) encoding cegion, premembrane/membrane protein (prM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-cutural proteins (NSI-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3' structural proteins (NSI-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3'

compositions and methods containing tetracycline or tetracycline-like compositions and methods containing tetracycline or tetracycline-like diseases. Such diseases include acute inflammatory responses and diseases. Such diseases (including diseases caused by with viral hemorrhagic diseases (including diseases caused by Bunyaviridea, Filoviridae, Flaviviridae or Arenaviridae viruses), parasitic diseases, bacterial infections, sepsis, cachexia, autoimmune disorders, acute cardiovascular events, chronic myelogenous leukaemia and transplanted bone marrow-induced graft-versus-host disease, septic shock, immune complex-induced colitis, cerebrospinal fluid inflammation, multiple sclerosis, inflammatory responses associated with trauma, systemic inflammatory response syndrome (SIRS), adult respiratory distress syndrome (ARDS), acute liver failure, inflammatory bowel disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compositions comprising tetracycline or tetracycline-like compount for the treatment and/or prevention of acute inflammatory responses and diseases, e.g. septic shock and immune complex-induced colitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dengue 2 virus; polyprotein; capsid; prM; M; E; NS1; NS2B; NS2B; NS3; NS4A; NS4B; NS5; PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/4 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome; DHF; DSS; PCR; amplify; polymerase chain reaction; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (B) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus in the diagnostic kit is useful in diagnosing flavivirus infection caused by DENV, WNV, JSV or SLEV. This sequence corresponds the complete nucleotide sequence of the DENV isolate WestPac.

                                                                                                                                                                                                The sequences given in AAT75909-T76029 are primers which were used in the amplification, cloning and sequencing of the Dengue-2 viral CDNA's of the invention. The Dengue 2 viral DNA encodes a polyprotein which comprises the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. The quadravalent vaccine of the invention comprises an attenuated Dengue virus, clone, PDK-53, and a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3, and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant protein products of the DNA constructs
                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                           PDK-53, a clone of infectious attenuated Dengue 2 virus strain 16681 also chimeric DEN-2/1, DEN-2/3 and DEN-1/4 viruses, used as a quadravalent vaccine for protecting against Dengue virus infection.

Human papillomavirus type 16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                    The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the companying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses immunity against several strains of pathogenic flaviviruses confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-3 (DEN-3) PGMK-30/FRNL-3 (30 passages in primary green monkey kidney (PGMK) cells, followed by 3 passages in fortus rhesus lung cells) virus protein variant used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquitoborne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-structural proteins (NS1-NS2A-NS2A-NS4A-NS4B-NS5) and finally a 3' non-coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2444448448
```

```
New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in a subject to be vaccinated since each component of the vaccine possesses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the same delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-) structural proteins present in each dengue virus serotype. The present sequence is that of the DEN3 cDNA plasmid P3 which is related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; cytostatic; virucide; dengue virus; recombinant replicon; deletion; preM protein; C protein; NS1 protein signal; vaccine; cervical cancer; viral disease; antigen; dendritic cell; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   terravalent and containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may useful for the development of compounds with a virucide or

A dengue virus recombinant replicon has a deletion of the complete coding sequence for prem protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the Whole of the 5'-end; the coding region of the front 20 amino acids in the C protein, and the coding region of NSI protein signal; coding regions of all non-structural proteins. The contained waccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a generation of the full-length dengue virus cDNA clone (PRS/FDD2). The recombinant virus vectors were transfected into baby the master kidney (BHK) cells to enable the screening of BHK-21 Tet-eff cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                          Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      se; cytostatic; virucide; dengue virus; recombinant replicon; deletion; prem protein; C protein; NS1 protein signal; vaccine; cervical cancer; viral disease; antigen; dendritic cell; immune response;

A dengue virus recombinant replicon has a deletion of the complete coding sequence for preM protein of dengue virus and also includes elements of c.g. the non-coding region in the whole of the 5'-end the coding region of c.g. the front 20 amino acids in the C protein, and the coding region of c.g. the front 20 amino acids in the C protein, and the coding region of c.g. the front 20 amino acids in the C protein, and the coding region of the ainced vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can cefficiently express antigen in infected cells, which is because dengue of virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the compares in munity especials where perpensed by using a generation of the full-length dengue virus cDNA clone cappessing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby canness ridney (BHK) cells to enable the screening of BHK-21 Tet-off cell inser. This sequence corresponds to an oligonucleotide used in the cell inces. This sequence corresponds to an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                   Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.

New subgenomic replicon of dengue virus origin comprising a deletion for the sequence coding for C, PreM and/or E structural proteins, useful as vaccines for immunization against dengue virus infection. (USSH ) US DEPT HEALTH & HUMAN SERVICES. Example 2; Page 38; 66pp; English 09-MAR-2001; 2001US-0274684P. Dayton AI, WPI; 2002-723344/78. Pang X, 

This invention describes a novel subgenomic replicon of dengue virus origin comprising a deletion for the sequence coding for C, PreM and E (Deltambe). Or for B (Deltambe) extructural proteins, and/or which is adapted to receive at least a nucleotide sequence without disrupting its replication capabilities. The products of the invention can be used for constructing (1) a vaccine or a therapeutic comprising the subgenomic replicon and a carrier; (2) a dengue virus-like particle comprising the subgenomic replicon, and structural proteins of the homologous dengue virus, which encapsulates the subgenomic replicon, and structural proteins of the individual the subgenomic replicon or the dengue virus like particle cited above. The subgenomic replicons are useful in gene therapy as vaccines for immuniaation against dengue virus infection. This sequence represents a PCR primer used with AAFB8837 to amplify the green fluorescent protein (GFP) gene cloned into the dengue virus deltapre-M/E replicon, at the site previously occupied by the pre-M/E genes

Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.

Example 1; SEQ ID NO 5; 38pp; Chinese.

A dengue virus recombinant replicon has a deletion of the complete coding sequence for prem protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end the non-coding region of the front 20 amino acids in the C protein, and the coding region of cof the front 20 amino acids in the C protein, and the coding region of NSI protein signal; coding regions of all non-structural proteins. The cobtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can cefficiently express antigen in infected cells, which is because dengue of virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the copying immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a generator expressing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to an oligonucleotide used in the

//clone the Tuebingen strain. Ist strand cDNA was primed with a Not I - oligo(dT) primer, double-stranded cDNA was cloned into the Not I and EcoRV sites of pExpress-1.
Library was size-selected for 1 kb fragments and normalized. A non-normalized version of this library is also available (NIH ZGC 10). Library was constructed by Open Biosystems (Huntsville, AL)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mol_type="mman" or procession of the procession
